

A young woman with glasses and a young man in school uniforms are looking at a document together. The woman is on the left, wearing a blue shirt and glasses, and the man is on the right, wearing a blue suit jacket and tie. They are both smiling and looking down at the document. The background is a blurred classroom setting.

Top Tips for Inclusive Science Teaching

IOP Institute of Physics

Limit Less and inclusive teaching

How can we make sure that all students feel they belong and have what they need to thrive?

At the Institute of Physics, our work is driven by the urgent need to address the fact that there are far too many people missing from our community. We know that many young people are put off studying physics after the age of 16, not because of a lack of ability or interest in the subject, but because of prevailing social attitudes that discourage them. Young people are exposed to the widespread misconception that physics is a subject for other people, perhaps people who they're told are cleverer than them, or who come from more privileged backgrounds or particular social and ethnic groups. This leads to many young people being told by those they trust, or reaching their own conclusion, that *'physics is not for them'*.

This view is reinforced from all around – be it from the education system, parents and carers, or among local communities and wider society. This must change. Limit Less is the campaign that aims to encourage and support young people to change the world and fulfil their potential by doing physics. It seeks to challenge the misconceptions and stereotypes about the subject and remove the barriers to young people doing physics beyond the age of 16.

The Limit Less campaign has identified five groups that are currently underrepresented or underserved in the physics community. These young people are less likely to do physics and more likely to face a hostile environment when they do. These groups are:

- Girls
- Young people from disadvantaged backgrounds
- Disabled young people
- LGBT+ young people
- Young people of Black Caribbean descent

If we want to build a thriving physics community, it's vital that we encourage more young people from diverse backgrounds to choose physics. We know that variety of experience and thought makes for better physics, and a better contribution from physics to solving the global challenges we face. This physics community will make a greater contribution to our economy, creating more jobs and growth. Importantly, we know that choosing to do physics gives young people the tools to understand their world and shape their future.

Your commitment to supporting the young people you work with means you have the daily opportunity to communicate the messages of the Limit Less campaign and to be an active part of the wider systemic change that's desperately needed.

The inclusive environment you create in your classroom needs to be part of an inclusive school, and that's why we're campaigning for all schools to have a whole-school equity approach and plan to removing the barriers that too many young people face.

Please add your voice to Limit Less to ensure that your commitment to inclusion is part of a bigger wave of systemic change in education and beyond: campaign.iop.org/manifesto

Contents

P. 5 About this booklet

Create an inclusive classroom culture

- P. 6 1. Enable all students to participate
 - P. 8 2. Examine and challenge stereotypes, biases and assumptions
 - P. 10 3. Model inclusive language and expect it from students
-

Make the learning relevant

- P. 12 4. Value students' existing knowledge and experience of science
 - P. 14 5. Teach about a range of jobs and careers that use science and science skills
 - P. 16 6. Give students opportunities to make links between their learning and their lives, interests and local area
-

Build numeracy and literacy for science

- P. 18 7. Build scientific vocabulary
- P. 20 8. Get students talking and listening
- P. 22 9. Make time for maths

About this booklet

This booklet is designed to support you with practical ways to make your teaching, interactions and classroom as inclusive as possible. You'll find nine guiding principles for inclusive teaching, arranged under the three themes of:

- Creating an inclusive classroom culture
- Making the learning relevant
- Building numeracy and literacy for science.

We explain why each principle is important and share some immediate practical steps you can take to put them into practice. There's also space throughout for you to write your thoughts and ideas, plan what you'd like to try out, and reflect on what works well in your classroom – we hope it will become an active document.

We've drawn on research including the Science Capital Teaching Approach and the IOP's own longstanding work on girls' participation in physics. To access further reading and to explore the evidence base, use the QR code found on the back cover of this booklet.

Enable all students to participate

Some students relish classroom discussions and practical activities while others may need alternative ways to participate.

Ideas to try...

Recognise students' effort and reasoning, not just correct answers, in order to build a culture where it's OK to make mistakes.

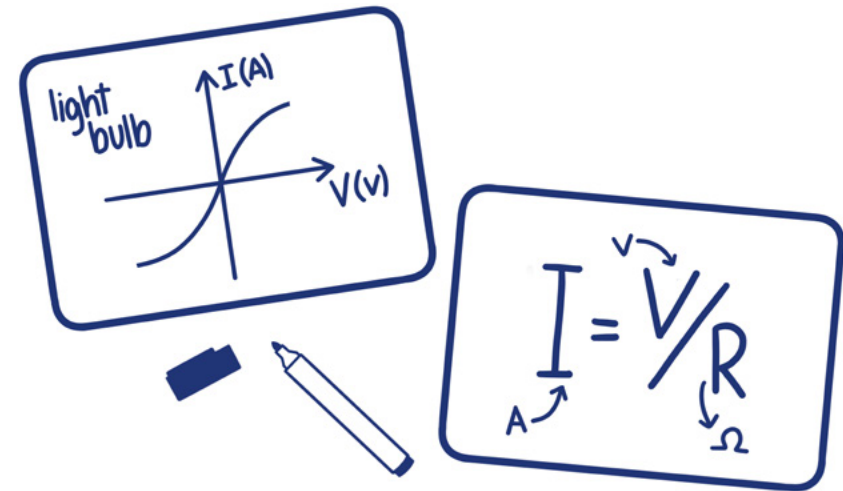

Use think-pair-share: give students time to think, then discuss their ideas with their partner in a low-pressure way, before sharing with the whole class.

Use mini whiteboards to encourage participation.

Use role cards for practical and group work so everyone is involved.

Use a visualiser to show demonstrations more safely and accessibly.

Use high contrast and a colour-safe palette, especially for graphs, for students with colour vision deficiencies.

Mini whiteboards can give students confidence to share their knowledge and understanding, and develop their thinking in a low-pressure way.

Notes and reflection

Examine and challenge stereotypes, biases and assumptions

It's important that teachers and students have a broad view of what science is, what scientists are like, who belongs in science and future pathways.

Ideas to try...

Critique the culture of science / representation in the history of science and what a 'good scientist' looks like.

Ask someone to keep a tally of interactions from different groups of students during a lesson. You may find some groups dominate while others are underrepresented.

Audit slides, wall displays and written resources to ensure diverse representation.

Embed examples of people from a diverse range of backgrounds doing science jobs.

Use examples of how science knowledge and skills are used in other contexts like music, sport and cooking.

to keep track of questioning...

whiteboard

??	✓?	?✓	✓✓	✓
✓	✓✓	✓✓	?✓	✓?
?	?✓	✓✓	?	
	?		??	??

Year 10 seating plan

Key:
 ? asks questions
 ✓ answers questions

Reflections:

- need to ensure I'm not just asking students at front to answer Qs!
- try no hands up questioning - use random name generator

Ask an observer to keep track of who answers and who asks questions in your lessons. Use a seating plan to keep a record.

Notes and reflection

Model inclusive language and expect it from students

All students should feel safe and that they belong in your class.

Ideas to try...

Challenge any discriminatory language.

Make sure your own language doesn't reinforce stereotypes.

Think carefully about how you use pronouns and vary the pronouns you use in examples.

Find out more about your students' identities and cultures to enable you to draw on a broader range of inclusive examples.

Notes and reflection

A roller skater moving in a straight-line has a momentum of 300 kg m/s. If they are moving at 4 m/s what is their mass?

Extension:

Use your understanding of momentum to explain how kneepads protect the roller skater if they fall

Choose examples, names and pronouns that challenge stereotypes.

Make the learning relevant

4

Value students' existing knowledge and experience of science

If students don't feel that people like them 'belong', it's difficult for them to feel competent and confident in science.

Help students to recognise themselves as someone who is 'sciencey'. Identify each student's unique knowledge and expertise that's relevant to science - recognise, value and build on it!

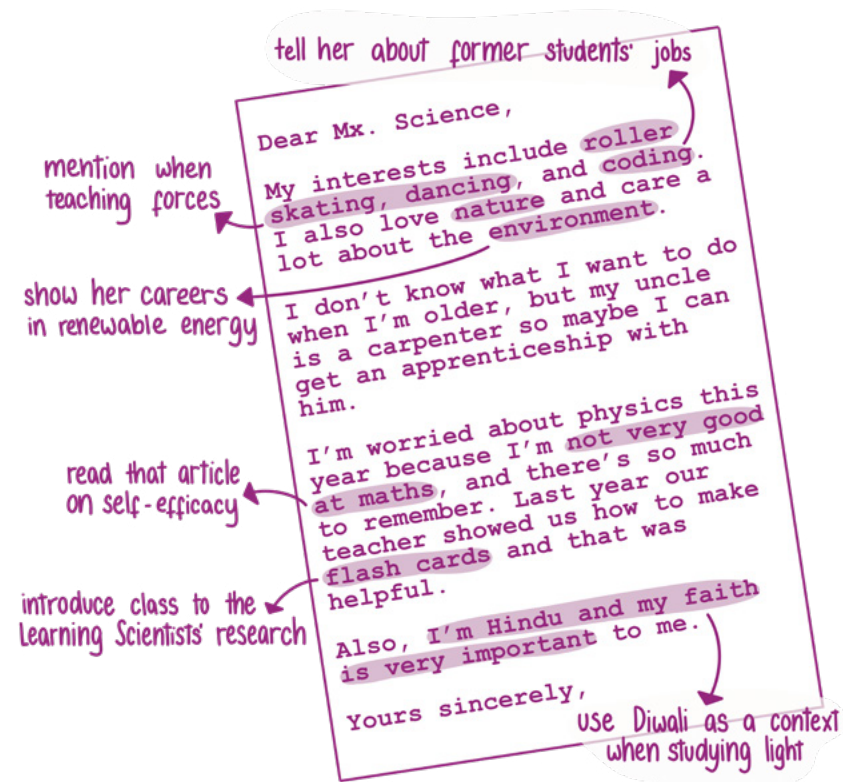

Ideas to try...

Find out your students' interests, aspirations and attitudes towards science by asking them to complete a questionnaire or write you a letter.

Start a new topic by establishing students' prior knowledge.

Make time for students to offer contributions from their own experiences, interests and identities, knowing that they'll be valued.

Give students opportunities to reflect on how their understanding has developed.

Ask students to write a letter introducing themselves, their interests and goals. Use this to inform contexts for learning.

Notes and reflection

Make the learning relevant

Teach about a range of jobs and careers that use science and science skills

Students are more likely to continue to study science if they can see it will help them with jobs they might want to do in the future.

Ideas to try...

Embed into your curriculum and resources:

- Jobs and careers in science.
- Jobs and careers that use science.
- Examples of science-related academic pathways.
- Examples of science-related vocational pathways.

Share the experiences of former students' science-related pathways where possible.

Invite former students and parents / carers doing science-related jobs to talk about their work and pathways.

Notes and reflection

HW: Research a physicist

Name: Yolanda
Job: biophysicist - she develops MRI scanners to study people's brains, so that diseases such as Alzheimer's can be detected early.

What Yolanda enjoys about her job:

- experiments.
- coming up with new ideas and testing them out.
- learning from things that go wrong.

What I think is interesting about Yolanda's job:

- it is much more creative than I expected - coming up with new ideas.
- it involves a lot of coding, which is something I enjoy.

"You have to work hard at anything to be good at it" - people say physics is hard, but so are lots of jobs, e.g. musician!

Source: Institute of Physics website

Set students a task to research a physicist or a physics-related job.

Build scientific vocabulary

There's a correlation between students' literacy levels and their science attainment.

Ideas to try...

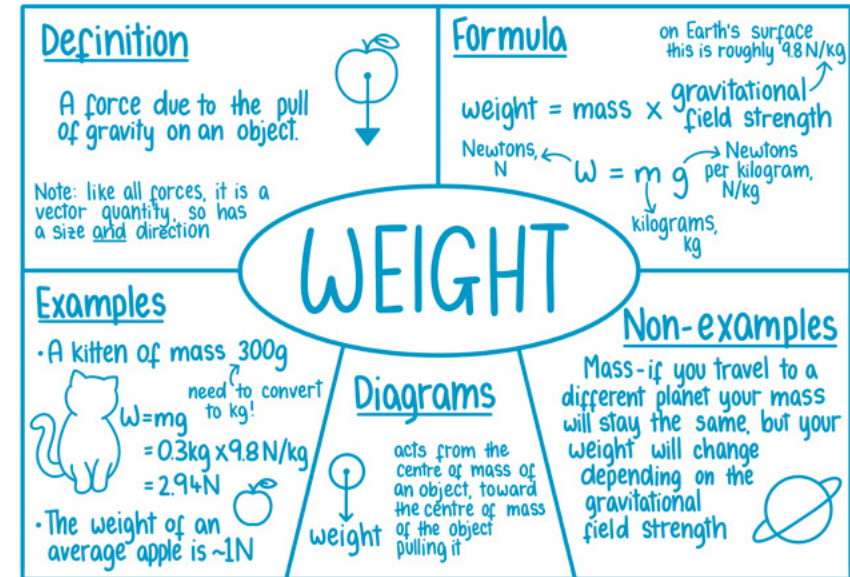

Start with everyday language, models and analogies to build understanding of concepts before introducing technical language.

Identify key words for each topic and explore their meaning with students; for example, using Frayer models.

Share the construction, roots and stories behind key words.

Regularly review vocabulary from previous topics.

Use quizzes, spelling/meaning tests and synoptic questions to regularly review key vocabulary.

Use Frayer models, such as this one, to help students develop their understanding of key words.

Notes and reflection

Get students talking and listening

Oracy builds students' understanding and confidence to use scientific vocabulary and helps them rehearse answers in preparation for writing.

Scaffold discussions so all students are able to communicate scientifically.

Ideas to try...

Communicate expectations and protocols for talking and listening.

Provide sentence starters or questions.

Use think-pair-share as a questioning strategy.

Assign roles to support active listening.

Invite students to challenge and build on each other's answers.

Give clear expectations for talking and listening.

Notes and reflection

Make time for maths

Remember that maths is often taught differently to science. Students may need support to transfer knowledge and skills from one discipline to another.

Ideas to try...

Liaise with your maths department so teaching is well aligned - find out how and when the skills needed in science are taught.

Teach students science-specific maths techniques and processes.

Observe a maths teacher teaching maths skills used in science.

Make effective use of worked examples and models such as bar models for proportional reasoning.

Allow plenty of opportunities to practise maths skills.

Explain key maths terms (like 'per').

Teach students how to make the best use of equation sheets.

To discuss with maths team:

- When are the maths skills needed in science taught?
→ e.g. standard form, graphs 
- How do you teach these skills?
→ e.g. rearranging equations $E_k = \frac{1}{2}mv^2$
- Can you use science as a context?
→ e.g. formula when teaching rearranging
- Are there differences in the language we use?
→ e.g. "range" 
- How can we support each other?
→ e.g. lending you equipment to teach density 
- How can we develop students' self-efficacy in maths?

Liaise with your maths department to support students with their maths skills.
